

High-Performance Servo Drives

Hardware and software design innovations deliver superior servo performance, high power density, simple commissioning, and extensive versatility in a cost-effective package.

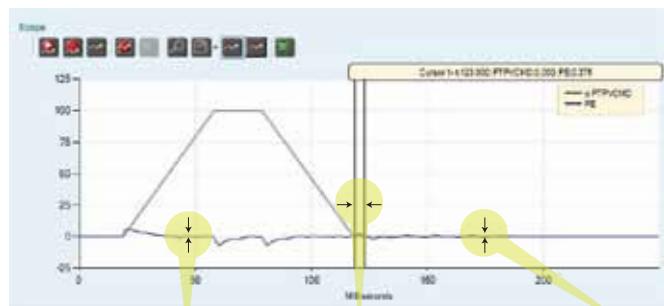

New current loop design achieves an industry-leading frequency response of 3-5 kHz

High sampling rates and flexible filtering options provide a faster response, and ensure maximum machine accuracy and throughput.

Advanced autotuning minimizes position error and settling time to almost zero

Engineering experience and expertise has been implemented in a sophisticated autotuning function that performs optimal configurations for a difference making performance.

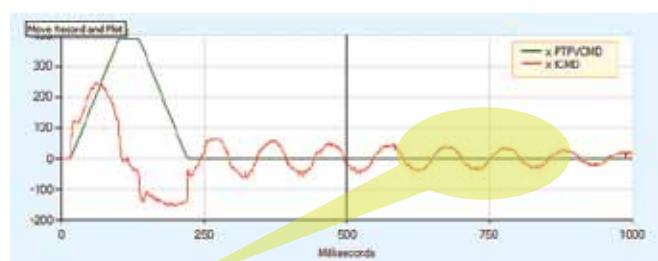

Minimum position error

Settling time of almost zero

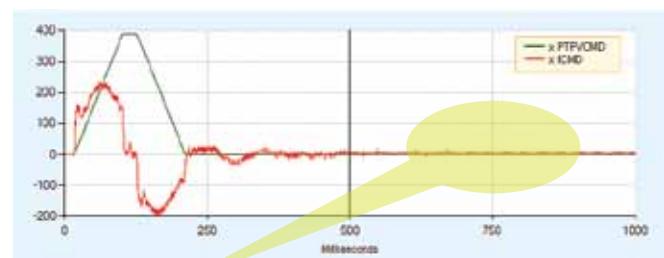

No oscillations at standstill

Innovative anti-vibration control algorithm eliminates mechanical resonance

An active non-linear algorithm eliminates vibration in highly flexible resonant systems. Commissioning is easy, using just a few gain parameters.
